

TECHNICAL DELIVERY MANAGER · TPM · DELIVERY SYSTEMS

Turning fragmented technical work into clear execution.

I build lightweight delivery systems that help product, engineering, and leadership teams move through ambiguity with clearer visibility, stronger decision flow, and less coordination drag — across UI, API, platform, analytics, and enterprise delivery environments.

CORE THESIS

Strong technical delivery is not status theater. It is a system for surfacing the right signal, clarifying ownership, sequencing work, and helping teams make pragmatic decisions before risk becomes escalation.

Delivery Visibility

Built health, blocker-aging, dependency, and risk views that surface gaps before they become escalations — earlier signal for better decisions.

Execution Alignment

Converted fragmented Jira, Confluence, and Teams updates into decision-ready signal for product leads, engineering leadership, and cross-team stakeholders.

Cross-Team Coordination

Coordinated product, engineering, architecture, analytics, vendor, offshore, and business partner workstreams across complex, high-dependency programs.

OPERATING MODEL: FROM FRAGMENTED INPUTS TO ROUTED SIGNAL

Inputs

Jira, Confluence, Teams, email, calendar, meetings

Normalize

Clarify ownership, status, dependencies, readiness, decisions

Detect

Blockers, aging work, scope drift, decision gaps, risk patterns

Route

ICs, leads, PMs, architects, partners, leadership

Act

Decide, sequence, unblock, communicate, adjust the plan

WHAT THIS BRIEF DEMONSTRATES

Senior TPM Judgment

How I structure ambiguous technical delivery work without over-engineering the process — sequencing, milestones, readiness, tradeoff facilitation, and dependency visibility across UI, API, platform, and analytics workstreams.

01

AI-Assisted Delivery Systems

How I use GenAI as a leverage layer for planning, synthesis, risk surfacing, and communication. Signal extraction from fragmented updates. Reusable delivery templates. Human judgment stays in control — AI reduces the admin drag that crowds it out.

02

CASE STUDY SNAPSHOTS

From systems thinking to built infrastructure.

Four case studies showing the arc: concept → build → scale → apply. All examples are sanitized — no confidential employer data.

01 · SYSTEMS DESIGN

Delivery Signal Routing

Delivery signals — blockers, aging work, at-risk items, dependency shifts — exist across every tool the team uses. Rarely synthesized before escalation.

- Designed signal-routing model: categorizes by...
- Explainability, audit trail, sensitivity rules — no...
- Conceptual model that directly informed the Sprint...

02 · DELIVERY INFRASTRUCTURE

Sprint Intelligence System

Sprint data in Jira tells a story — assembling it takes manual effort. Risk stays buried. Planning gaps surface too late to course-correct.

- 42+ scripts: live Jira data → sprint health,...
- One command. Under 2 minutes. Full delivery picture.
- Delivery Home Base: browser interface for delivery...

03 · AI-ASSISTED DELIVERY

Delivery Skill Library

Delivery leads lose leverage when recurring admin — health checks, working agreement audits, status updates — crowds out judgment and alignment.

- 10+ Claude skills: working agreement health,...
- Working agreement health pulls live Jira data;...
- Started personal → used with team → now spreading to...

04 · PROGRAM LEADERSHIP

Cross-Team Execution Visibility

When delivery spans product, UI, API, analytics, and platform workstreams, status fragments. Decisions wait on information that hasn't been synthesized.

- Designed visibility systems: sprint planning, release...
- Turned scattered updates into leadership-ready...
- Reduced coordination drag across product,...

WHY THIS POSITIONS ME FOR SENIOR DELIVERY LEADERSHIP ROLES

- Balances strategic direction with practical execution details across teams, systems, and decision-makers.
- Creates lightweight structure for ambiguous, high-dependency work without slowing engineering teams down.
- Connects delivery data, platform dependencies, UI workstreams, operational readiness, and leadership visibility.
- Uses GenAI as a practical leverage layer — builds tooling that other practitioners are now adopting.

OPERATING PRINCIPLES

Clarity over status theater

The right signal to the right person at the right time outperforms any formatted update.

Dates from flow, not pressure

Realistic sequencing beats optimistic commitments. Dates come from readiness.

Process should reduce drag

Every mechanism earns its place by making delivery easier — not by checking a governance box.

Route the right signal

Delivery intelligence is only useful if it reaches the right audience. Routing matters.

Protect engineering focus

Good delivery leadership improves visibility without increasing interruptions to builders.

AI accelerates judgment

Remove the admin overhead that crowds out thinking. Never replace the thinking itself.
